PROGRAMMING IN JAVA

Assignment6

TYPE OF QUESTION: MCQ

Number of questions: 10 Total mark: $10 \times 1 = 10$

QUESTION 1:

Which of the following is NOT a method of the Thread class in Java?

- a. isInterrupted()
- b. interrupt()
- c. joins()
- d. sleep()

Correct Answer: c

Detailed Solution:

join() is a method in the pre-defined Java class Thread but not joins(). Other methods like isInterrupted (),interrupt () and sleep() are defined in the Thread class.

QUESTION 2:

Which of the following statement(s) is/are true?

- a. public int getId(): returns the id of the thread.
- b. public boolean isAlive(): tests if the thread is alive.
- c. public void interrupt(): interrupts the thread.
- d. public boolean isInterrupted(): tests if the thread has been interrupted.

Correct Answer: a,b,c,d

Detailed Solution:

All options are correct.

QUESTION 3:

Which of the following can be used to create an instance of Thread?

- a. By implementing the Runnable interface.
- b. By extending the Thread class.
- c. By creating a new class named Thread and calling method run().
- d. By importing the Thread class from package.

Correct Answer: a, b

Detailed Solution:

An application that creates an instance of Thread must provide the code that will run in that thread. There are two ways to do this:

- *Provide a Runnable object.* The Runnable interface defines a single method, run, meant to contain the code executed in the thread. The Runnable object is passed to the Thread constructor
- Subclass Thread. The Thread class itself implements Runnable, though its run method does nothing. An application can subclass Thread, providing its own implementation of run

Reference:https://docs.oracle.com/javase/tutorial/essential/concurrency/runthread.html

QUESTION 4:

What is the output of the following program?

```
public class Question
{
   public static void main(String[] args) {

       try {
          int a=5/0;
     } catch (Exception e) {

          catch (ArithmeticException a) {

       }
     }
     System.out.println("Hello World");
   }
}
```

- a. Hello World
- b. 5
- c. Compile time error
- d. ArithmeticException

Correct Answer: c

Detailed Solution:

This first handler catches exceptions of type Exception; therefore, it catches any exception, including ArithmeticException. The second handler could never be reached. This code will not compile.

QUESTION 5:

NPTEL Online Certification Courses

Indian Institute of Technology Kharagpur

Which one of these keywords must be used to handle the exception thrown by try block in some rational manner?

- a. try
- b. finally
- c. throw
- d. catch

Correct Answer: d

Detailed Solution:

The catch block is responsible for handling handling the exceptions raised by try block.

QUESTION 6:

Which of the following will contain the body of the thread?

a. run();b. start();c. stop();d. main();

Correct Answer: a

Detailed Solution:

The run() method of a thread is same as the main() method for an application. Starting the thread causes the object's run method to be called.

QUESTION 7:

The following is a simple program using the concept of thread.

```
public class Question extends Thread{
  public void run() {
    for(int i=1;i<5;i++) {

        System.out.println(i++);
     }
  }
  public static void main(String args[]) {
        Question t1=new Question();
     t1.run();
  }
}</pre>
```

What is the output of the above program?

- a. 1 3
- **b**. 1
- D. 1 2
 - 3
 - 4
- c. Runtime error
- d. 1 2

Correct Answer: a

Detailed Solution:

QUESTION 8:

NPTEL Online Certification Courses

For the program given below, what will be the output after its execution?

```
public class Main{
  public static void main(String[]args) {
          Thread thread=Thread.currentThread();
          System.out.println(thread.activeCount());
        }
}
```

- a. 0
- b. true
- **c.** 1
- d. false

Correct Answer: c

Detailed Solution:

java.lang.Thread.activeCount(): Returns an estimate of the number of active threads in the current thread's thread group and its subgroups.

QUESTION 9:

Which of the following is a correct constructor for a thread object?

```
a. Thread(Runnable a, String str);b. Thread(Runnable a, int priority);c. Thread(Runnable a, ThreadGroup t);d. Thread(int priority);
```

Correct Answer: a

Detailed Solution:

Thread (Runnable a, String str) creates a new Thread object. The others are not valid constructors to create a thread object.

QUESTION 10:

Which of these keyword(s) is used to manually throw an exception?

- a. try
- b. finally
- c. throw
- d. catch

Correct Answer: c

Detailed Solution:

The throw keyword is used to manually throw an exception.
